

Task 1: Deployment of the baseline model

Task 3: Deployment of the finetuned model

Discussion (Task 4):

I have noticed that the finetuned model generally performs better and has more accuracy. By undergoing additional training on a specialized dataset, the model demonstrates a significant reduction in hallucination and a more precise understanding of domain-specific nuances. And it definitely helps for my specific writing style because it is fine-tuned with my own data, allowing it to capture unique linguistic patterns, tone, and vocabulary that the baseline model lacks. This personalization ensures that the generated outputs feel more authentic and aligned with the intended communicative goals.
